SUMMARY

Backend engineer with 5+ years of experience developing and maintaining production-grade software systems using Python, Django, Django REST Framework, Node.js, NestJS, and Express.js. Proficient in Git, Docker, and managing CI/CD pipelines. Skilled in analyzing and navigating complex codebases, configuring environments, and improving software test coverage. Experienced working with Agile teams, contributing to scalable solutions, and collaborating across engineering and product teams. Strong interest in open-source projects, automation, and AI-powered development workflows.

SKILLS AND TECHNOLOGIES

Languages & Frameworks: Python, Django, Django REST Framework, Pydantic, JavaScript, TypeScript, Node.js, Express.js, NestJS.

Data & Messaging: PostgreSQL, Sequelize, TypeORM, MongoDB, Redis, Elasticsearch, Apache Kafka, RabbitMQ, Celery.

Cloud & DevOps: Docker, AWS (EC2, S3, Textract), GitHub Actions, SonarQube.

Practices: Agile / Scrum, OpenAPI / Swagger, Maker-Checker & Audit Systems, Jest & Pytest, Git & Code Review.

PROFESSIONAL EXPERIENCE

Peerless

February 2024 - Present

Backend Engineer

- Core contributor (#3 of 60+ contributors) to the customer management service of a multi-tenant core banking platform used by several banks and fintechs.
- Built maker-checker workflows with segregation of duties, department- and branch-scoped approvals, and audit trails that record previous values across 10+ request types.
- Delivered core-banking account controls: mandates and signatories, liens, restrictions, stop-cheque (with charge and tax journal posting), withdrawal thresholds, and obligor limits.
- Implemented account closure with automated balance transfer and interest/earnings calculation, integrated with the core banking system's transfer and journal APIs.
- Set up a Customer 360 service from scratch (NestJS, TypeORM, Redis), powering ops dashboards and channel lookup APIs by BVN, NIN, phone number, and account number.
- Built bulk pipelines for customer migration, restrictions, and account-officer reassignment, with query and upload optimizations for large files.
- Shipped joint, corporate (beneficial-owner), and custodial-minor onboarding, including an automated job that hands accounts over when a minor comes of age.
- Built event-driven integrations on Kafka — producers for customer and account events, consumers for notifications — and migrated a Django service's background jobs from Celery to Kafka.

Technologies: Node.js, Express.js, NestJS, TypeScript, Python, Django REST Framework, PostgreSQL, Kafka, Redis, Docker.

Herconomy

February 2022 - February 2024

Backend Engineer

- Collaborated with the Product Marketing team to develop a robust referral system, driving customer acquisition through referral codes and bonuses.
- Built a fast and responsive PDF generation system for user account statements, tracking transactions and balances.
- Engineered an automated goal-based savings feature, enabling users to save towards specific financial goals.
- Created a wallet system to help parents save for their children's future.
- Developed an automated piggy bank system, allowing scheduled deposits and withdrawals to encourage disciplined saving habits.
- Set up and configured development environments using Docker; used Python for data scraping and analysis tasks.

Technologies: Node.js, Express.js, Python, Django, Django REST Framework, Docker, Git, RabbitMQ, AWS EC2, AWS S3.

Decagon Labs
June 2021 - January 2022

Backend Engineer

- Designed, developed, and tested end-to-end user flows for subscription services (platform and meals), account tiering, ordering, and notifications in a client's food delivery and ordering web application.
- Optimized user journeys and flows to enhance user satisfaction and ensure compliance with documentation standards across multiple outsourced products.
- Built cross-platform APIs for a booking appointment system, enabling seamless scheduling between patients and healthcare providers.
- Developed a basic fintech wallet system, allowing users to save funds and perform in-app transfers for faster transactions.
- Utilized Python web scraping techniques to analyze and identify the top five most frequently used words within an application for data-driven insights.

Josla Electric Company Ltd.
May 2020 - June 2021

Backend Engineer (Intern)

- Designed and developed the complete backend infrastructure for an enterprise electricity management tool, enabling efficient tracking of users' electrical usage and data.
- Integrated third-party API services to streamline ordering and payment processes within the enterprise backend system.
- Collaborated closely with the design team to understand user requirements, propose technical solutions, and implement key software features.

EDUCATION

Covenant University, Canaanland Ota

B.Sc. Bachelor of Science, 2019

CERTIFICATION

Scrum Fundamentals Certified (SFC) - VMEdu Inc.

PROJECTS

Dinma API
The Health Services Booking System is a Django-based web application designed to connect healthcare providers with patients. Patients can sign up, search for providers, and book appointments, while providers manage their schedules and patient interactions.

Technologies Used: Node.js, Express.js, Django, Django REST Framework, Python.
Link: https://dinma-web.netlify.app/

Hitchpay
Backend development for a fintech application handling core financial operations, built for reliability and data accuracy under real transaction volume.

Technologies Used: Express.js, Python, Django, Django REST Framework.
Link: https://www.hitchpay.ng/

Troo (TrooHQ)
A multi-branch retail and restaurant management platform. Worked on backend systems for branch operations, self-checkout, menu and order management, employee roles and permissions, subscription plans, and TrooPay, a dedicated payments middleware integrating Paystack and Flutterwave.

Technologies Used: Node.js, Express.js, MongoDB, Django, Paystack, Flutterwave, Docker.
Link: https://troohq.com/

Herconomy Savings Platform
Core savings infrastructure for a consumer fintech platform: goal-based savings, an automated piggy-bank engine with scheduled deposits, a family wallet system, and a referral engine tied to acquisition bonuses.

Technologies Used: Django, Django REST Framework, Node.js, Express.js, RabbitMQ, Docker.
